REC'D 12 JAN 2000	
WIPO	PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

**Warning**

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

**Notes**

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

PHARMACEUTICAL COMPOUNDS FOR THE INHIBITION  
OF HEPATITIS C VIRUS NS3 PROTEASE

This invention relates to compounds which can act as  
5 inhibitors of the hepatitis C virus (HCV) NS3 protease,  
to uses of such compounds and to their preparation.

The hepatitis C virus (HCV) is the major causative  
agent of parenterally-transmitted and sporadic non-A,  
10 non-B hepatitis (NANB-H). Some 1% of the human  
population of the planet is believed to be affected.  
Infection by the virus can result in chronic hepatitis  
and cirrhosis of the liver, and may lead to  
hepatocellular carcinoma. Currently no vaccine nor  
15 established therapy exists, although partial success has  
been achieved in a minority of cases by treatment with  
recombinant interferon- $\alpha$ , either alone or in combination  
with ribavirin. There is therefore a pressing need for  
new and broadly-effective therapeutics.

20

Several virally-encoded enzymes are putative targets  
for therapeutic intervention, including a metalloprotease  
(NS2-3), a serine protease (NS3), a helicase (NS3), and

00-51-85-11

an RNA-dependent RNA polymerase (NS5B). The NS3 protease is located in the N-terminal domain of the NS3 protein, and is considered a prime drug target since it is responsible for an intramolecular cleavage at the NS3/4A  
5 site and for downstream intermolecular processing at the NS4A/4B, NS4B/5A and NS5A/5B junctions.

Previous research has identified classes of peptides, in particular hexapeptides, showing degrees of  
10 activity in inhibiting the NS3 protease. The aim of the present invention is to provide further compounds which exhibit similar, and if possible improved, activity.

According to the nomenclature of Schechter & Berger  
15 (1967, Biochem. Biophys. Res. Commun. 27, 157-162) cleavage sites in substrates for the NS3 protease are designated P6-P5-P4-P3-P2-P1...P1'-P2'-P3'-P4'-, with each P representing an amino acid, and the scissile bond lying  
between P1 and P1'. Corresponding binding sites on the  
20 enzyme are indicated as S6-S5-S4-S3-S2-S1...S1'-S2'-S3'-S4'.

The present applicant has previously disclosed so called product inhibitors which are based on the P-region

N 28.12.99

of the natural cleavage sites and which have been  
optimised to low nanomolar potency ((1998) Biochemistry  
37: 8899-8905 and (1998) Biochemistry 37: 8906-8914.

These inhibitors extract much of their binding energy

5 from the C-terminal carboxylate, the remaining  
interactions with NS3 being similar to the ones used by  
the natural substrates, including binding in the S<sub>1</sub> pocket  
and the prominent electrostatic interaction of the P6-P5  
acidic couple.

10

At variance with the P region, the P' region of  
the substrate, while being important for catalysis, does  
not influence significantly ground-state binding to the  
enzyme as expressed by the K<sub>m</sub> value. In other words,

15 binding energy released by the substrate interaction with  
the enzyme to form an initial non-covalent complex is  
essentially due to the interaction of the residues of the

P region; the P' region residues contribute to a lesser  
extent to the binding energy. Accordingly, peptides

20 based on the P' region of the natural substrates (spanning  
residues P<sub>1</sub>'-P<sub>10</sub>') do not inhibit NS3 to any significant  
extent. This notwithstanding, inspection of the crystal  
structure of NS3 with or without 4A (and more recently of

00.01.02.11

the NMR structure of NS3) shows the presence of binding  
pockets in the S' region which might be exploited for the  
binding of active-site directed inhibitors. S'-binding  
ligands would therefore display a range of interactions  
5 with the enzyme different from the ones used by the  
substrate, and represent a novel class of NS3 inhibitors.

Landro et al in (1997) *Biochemistry* 36, 9340-9348  
synthesized certain non-cleavable decapeptides based on  
10 the NS5A/5B cleavage site by substituting the P<sub>1</sub>' serine  
by a bulky cyclic aromatic (tetrahydroisoquinoline-3-  
carboxylic acid) or smaller cyclic alkyl compound  
(proline or pipecolinic acid). They then investigated  
the interaction of these decapeptides with the substrate  
15 binding site of NS3 either in the presence or absence of  
NS4A cofactor. By looking at the effect of truncation at  
either the P or P' side of the molecule they concluded  
that most of the binding energy of the decapeptide is due  
to interactions with NS3-NS4A complex on the P side of  
20 the molecule. Truncation on the P' side produced a  
relatively large effect in the presence of NS4A cofactor,  
but less when NS4A was absent. They concluded that the  
P4' substrate Tyr residue present in their molecules was

M 28.12.99

in close proximity, or in direct contact with NS4A and that this residue contributes significantly to binding in the presence of NS4A.

5           The present inventors have developed inhibitors which are more powerful than those described by Landro et al because they have better binding on their P' side. In other words, the inhibitors take advantage of binding to the S' region in addition to binding to the S-region of  
10 NS3. By varying the P' amino acid residues, the present inventors have shown that the binding energy which may be extracted from S'-region binding is substantial, since inhibitors with optimised and non-optimised P'-regions differ in potency > 1000-fold. Since no activity was  
15 present in any of the peptides corresponding to the isolated P'-region, optimisation of an S'-binding fragment was pursued in the context of non-cleavable decapeptides spanning P<sub>6</sub>-P<sub>4</sub>'.

20           The inventors found that, by replacing Landro's P4' Tyr residue by leucine the effectiveness of the decapeptides as NS3 protease inhibitors could be enhanced. Although it had been previously shown that

00 01 35 M

leucine in position P4' is better than tyrosine in a  
decapeptide substrate cleavable by NS3 (Urbani et al  
(1997) J. Biol. Chem 272, 9204-9209), this is the first  
showing that the same applies to decapeptide inhibitors  
5 which are not cleaved under the influence of the enzyme.  
By optimising the P4' residue and then the P2'-P3' fragment  
and using these together with an optimised P region the  
inventors have arrived at oligopeptides which show  
potency in the low nanomolar-subnanomolar range.

10

According to a first aspect of the present invention  
there is provided a compound having the formula (I)  
(written from N-terminus to C-terminus):

15

Pep-A'-B'-C'-D' (I)

20

wherein "Pep" is a peptide or peptide analogue  
capable of binding to HCV NS3 protease; in particular, it  
is capable of binding in the S-region of the protease;

A' is proline which is optionally substituted, for  
instance with one to three substituent groups;

11.25.12.99

B' is an amino acid or amino acid analogue having a non polar side chain. Preferably, the side chain is an alkyl, aryl or aralkyl group containing 3 to 10, particularly 4 to 8 carbon atoms;

5

C' is an amino acid or amino acid analogue having a polar side group. Examples of polar side group may contain between 2 and 10, preferably 2 to 6 carbon atoms;

10

D' is leucine, or less preferably another amino acid with a non-polar aliphatic side chain, such as valine, isoleucine, norleucine or methionine. Alternatively, it is a short peptide or peptide analogue having one of these amino acids, especially leucine at its N terminus.

15

The short peptide or peptide analogue may, for instance comprise 2 to 6, preferably 2 to 4 amino acids or amino acid analogues.

20

The Pep-A bond of the compound of formula (I) is substantially uncleavable by HCV NS3 protease. For instance, it is preferable that no cleavage be detectable using the assay described below under the heading "Substrate Assay".

00 01 00 14

Preferably, the compound of formula (I) is N-terminally acylated, especially acetylated, although other derivatives of the N-terminus are also possible, for instance N-terminal sulphoxide, sulphonamide,  
5 urethane or urea derivatives.

Preferably, the compound of formula (I) is C-terminally amidated. However, the C-terminus may be an underivatised carboxylic acid group. Alternatively,  
10 other C-terminal groups may be present.

Pharmaceutically acceptable salts of the compound of formula (I), as well as derivatives, such as esters are within the scope of the present invention provided that,  
15 in the case of derivatives, they may be converted in vivo to a compound of formula (I).

Assuming no substitution of the proline residue at A' is present, then a preferred C-terminal portion of the  
20 compound of formula I is:

Pro-B'-C'-Leu

M 26.12.99

possibly with a short C terminal extension at Leu.

Preferred examples of the amino acid, or analogue, B' for inclusion in compounds of the first aspect of the invention, include:

5  $\beta$ -cyclohexylalanine, phenylglycine, homophenylalanine and norleucine; other possibilities, though less preferred, are leucine, methionine, 10 norvaline, and  $\beta$ -cyclopropylalanine. Of all these, cyclohexylalanine and phenyl glycine are most preferred.

Examples of the amino acid or analogue, C' include aspartic acid, glutamic acid,  $\gamma$ -carboxyglutamic acid, 15 glutamine, asparagine, and hydroxyproline. Slightly less preferred are N- $\beta$ -Aloc-diaminobutyric acid, thiazolylalanine, methionine sulfoxide, pyridylalanine and serine. Of all of these aspartic acid is most preferred.

20

The following combinations of amino acid residues at B' and C' are preferred, of which the combination of cyclohexylalanine and aspartic acid is especially

00-01-85 M

preferred.

TABLE 1

	B'	C'
5	Cha	Ser
	Cha	Asp
	Nle	Asp
	Hof	Asp
	Phg	Asp
10	Cha	Gln
	Nle	Gln
	Hof	Gln
	Cha	Hyp
	Nle	Hyp
15	Hof	Hyp
	Nle	Ser

Notes: Cha =  $\beta$ -cyclohexylalanine.

Nle = norleucine.

20 Phg = phenylglycine.

Hof = homophenylalanine.

Hyp = hydroxyproline.

When the residue D' is leucine (or other amino acid)  
25 with a small peptide as C-terminal extension the peptide  
may be chosen by comparison with the corresponding P'

M 25.12.99

portion of natural substrates.

The residues A', B', C' and D' may have D- or L- stereochemistry, although L-stereochemistry is, in general, preferred for each.

As regards the Pep part of the compound of formula (I) this is particularly preferably a peptide or peptide analogue capable of binding to HCV NS3 protease, even in the absence of the C-terminal residues A'-B'-C'-D', for instance when Pep carries just a carboxylic acid group at the C terminus. For example, when tested in the inhibition assay described below the fragment Pep-OH preferably has an IC<sub>50</sub> below 100 μM, e.g. below 20 μM, particularly below 10 μM and, optimally, of less than 1 μM. Preferably, Pep is a hexa-, penta- or tetra peptide having formula II below:

F-E-D-C-B-A

wherein: A is an amino acid or amino acid analogue having a relatively small (C<sub>1</sub>-C<sub>6</sub>) aliphatic side chain. Possible choices for this group include cysteine,

00-01-88 M

aminobutyric acid (Abu) (including di- and tri-fluoro Abu), norvaline, allylglycine and alanine, any of which may be N-methylated. Of these, cysteine and the fluorinated aminobutyric acids are preferred choices for

5 A.

B is an amino acid or analogue having a non-polar or acidic side chain. Some amino acids having polar but uncharged side groups may also be suitable. Examples of  
10 suitable amino acids include glutamic and aspartic acid, glycine and methyl glycine, 2-amino butyric acid, alanine, isoleucine, valine, leucine, cysteine, naphthylalanine and  $\beta$ -cyclohexylalanine. Of these, cyclohexylalanine is particularly preferred.

15

C is an amino acid or amino acid analogue having a non-polar or acidic side chain. For instance, the examples of such amino acids given above for B apply also to C. In this case isoleucine and glutamic acid are  
20 particularly preferred.

D is usually an amino acid or amino acid analogue having a hydrophobic side group such as methionine,

M 25.12.99

isoleucine, leucine, norleucine, valine, methyl valine, phenylglycine or, diphenylalanine. Among these leucine and, particularly, diphenylalanine are preferred. Some polar amino acids such as tyrosine, thienylalanine, and  
5 chlorophenylalanine may be suitable.

E together with F may be absent, but if present is generally an amino acid or amino acid analogue having an acidic side chain. Preferred examples are glutamic and  
10 aspartic acid, with the former being preferred. E may, alternatively, be an amino acid or analogue having a non-polar, or polar but uncharged side chain. Of the non-polar amino acids, phenylalanine, diphenylalanine, isoleucine and valine are preferred, especially the D-  
15 enantiomers. Among the polar amino acids suitable examples are tyrosine and 4-nitrophenylalanine.

Alternatively, where F is absent (see below), E may be a dicarboxylic acid containing up to 6 carbon atoms and lacking the amino group of acidic amino acids. Suitable  
20 examples are glutaric and succinic acid.

F may be absent (either by itself, or together with E), but when present is an amino acid or analogue having

00.01.02 M

an acidic side chain. Aspartic acid is preferred, although glutamic acid is another possibility. Like E, F may also be a dicarboxylic acid containing up to 6 carbon atoms, and lacking the amino group of acidic amino acids.

5 Examples are glutaric and succinic acid.

Of residues E and F preferably at least E is present. Particularly preferably both are present.

10 The amino acids and analogues A-F may be either L- or D- enantiomers though L- is generally preferred for all residues. In some cases it may be beneficial for one or other of the residues to be D- while the rest are L-. In particular it may be advantageous for E to be D-glu.

15

Preferred examples of the peptide "Pep" are listed below in Table 2 together with their  $IC_{50}$  values when unextended at the C-terminus.

\* Tested only as decapeptides

In these compounds:

5	Alg	=	allylglycine.
	MGly	=	methylglycine.
	MVal	=	methylvaline.
	Abu	=	2-aminobutyric acid.
	GluS	=	N-succinylglutamic acid.
10	AsGlu	=	Glutamic acid having N-terminal acylsulphonamide.
	Cha	=	$\beta$ -cyclohexylalanine.
	Nap	=	naphthylalanine.
	AspS	=	N-succinylaspartic acid.
15	Nle	=	norleucine.
	Dif	=	3,3-diphenylalanine.
	Tha	=	2-thienylalanine.
	FCI	=	4-chlorophenylalanine.

00:01:00 M

	Phg	=	phenylglycine.
	CysMe	=	S-methylcysteine.
	Cys(ACS)	=	Cysteine with C-terminal acylsulphonamide.
5	DHAla	=	dehydroalanine.
	Cpc	=	1-amino-1-cyclopentane carboxylic acid.
	CnAla	=	cyanoalanine.
	MGLu	=	N-methylglutamic acid.
10	Fno	=	4-nitrophenylalanine.
	Gla	=	$\gamma$ -carboxyglutamic acid.
	Dap	=	$\beta$ -diaminopropionic acid.
	Dns	=	dansyl(5-dimethylamino-1- naphthalene-sulfonyl).

15

Examples of compounds of the present invention may be effective as inhibitors of NS3 protease at micromolar or nanomolar levels. Preferably, the  $IC_{50}$ , as measured in the assay described below is less than 100nM,

4 25.12.99

particularly preferably less than 20nM and, optimally,  
less than 5nM.

According to a second aspect, the present invention  
5 provides a compound or derivative according to the first  
aspect, for use in any therapeutic method, preferably for  
use in inhibiting the HCV NS3 protease, and/or for use in  
treating or preventing hepatitis C or a related  
condition. By "related condition" is meant a condition  
10 which is or can be caused, directly or indirectly, by the  
hepatitis C virus, or with which the HCV is in any way  
associated.

According to a third aspect the present invention  
15 provides the use of a compound or derivative according to  
the first aspect in the manufacture of a medicament for  
the treatment or prevention of hepatitis C or a related  
condition.

00-01-85 M

A fourth aspect of the invention provides a pharmaceutical composition which includes one or more compounds or derivatives according to the first aspect.

5           The composition may also include pharmaceutically acceptable adjuvants such as carriers, buffers, stabilisers and other excipients. It may additionally include other therapeutically active agents, in particular those of use in treating or preventing  
10   hepatitis C or related conditions.

The pharmaceutical composition may be in any suitable form, depending on the intended method of administration. It may for example be in the form of a  
15   tablet, capsule or liquid for oral administration, or of a solution or suspension for administration parenterally.

According to a fifth aspect of the invention, there is provided a method of inhibiting HCV NS3 protease

M 25.12.99

activity, and/or of treating or preventing hepatitis C or  
a related condition, the method involving administering  
to a human or animal (preferably mammalian) subject  
suffering from the condition a therapeutically or  
5 prophylactically effective amount of a composition  
according to the fourth aspect of the invention, or of a  
compound or derivative according to the first aspect.  
"Effective amount" means an amount sufficient to cause a  
benefit to the subject or at least to cause a change in  
10 the subject's condition.

The dosage rate at which the compound, derivative or  
composition is administered will depend on the nature of  
the subject, the nature and severity of the condition,  
15 the administration method used, etc. Appropriate values  
can be selected by the trained medical practitioner.  
Preferred daily doses of the compounds are likely to be  
of the order of about 1 to 100 mg. The compound,  
derivative or composition may be administered alone or in

00-51-83 M

combination with other treatments, either simultaneously or sequentially. It may be administered by any suitable route, including orally, intravenously, cutaneously, subcutaneously, etc. Intravenous administration is  
5 preferred. It may be administered directly to a suitable site or in a manner in which it targets a particular site, such as a certain type of cell - suitable targeting methods are already known.

10 A sixth aspect of the invention provides a method of preparation of a pharmaceutical composition, involving admixing one or more compounds or derivatives according to the first aspect of the invention with one or more pharmaceutically acceptable adjuvants, and/or with one or  
15 more other therapeutically or prophylactically active agents.

According to a seventh aspect of the invention there is provided a method of producing the compounds of

4 25 12 99

formula I. These compounds may be generated wholly or partly by chemical synthesis beginning from individual, preferably protected, amino acids or oligopeptides and using known peptide synthesis methods.

5

Embodiments of the invention are exemplified below by way of illustration only.

#### EXAMPLES

10

##### (1) Synthesis

The synthesis of one of the compounds of the present invention is described below. Other compounds may be synthesized by an analogous method.

15

Synthesis of Ac-Asp-(D)Glu-Leu-Ile-Cha-Cys-Pro-Cha-  
Asp-Leu-Pro-Tyr-Lys (N<sup>ε</sup>-Ac)-NH<sub>2</sub>

The synthesis was performed on solid phase by the

00018514

continuous-flow Fmoc-polyamide method (Atherton, E. and Sheppard, R. C. (1989) Solid phase peptide synthesis. A practical approach, IRL Press, Oxford.) . The resin used was Tentagel<sup>®</sup> derivatised with a modified Rink amide linker p-[(R,S)- $\alpha$ -[1-(9H-Fluoren-9-yl)-methoxyformamido]-2,4-dimethoxybenzyl]-phenoxyacetic acid (Rink, H. (1987) *Tetrahedron Lett.* 28, 3787-3789; Bernatowicz, M. S., Daniels, S. B. and Koster, H. (1989) *Tetrahedron Lett.* 30, 4645-4667) . All the coupling reactions were performed for 30 min with 5-fold excess of activated amino acid over the resin free amino groups, using Fmoc-amino acid/PyBOP/HOBt/DIEA (1:1:1:2) activation; double coupling was used for the cysteine residue. At the end of the assembly, the dry peptide-resin was treated with trifluoroacetic acid/water/triisopropylsilane (92.5:5:2.5) for 1.5h at room temperature; the resin was filtered out and the peptide precipitated with cold methyl t-Bu ether; the precipitate was redissolved in 50% water/acetonitrile containing 0.1%TFA and lyophilised.

M 26.12.99

Purification to >98% homogeneity was achieved through preparative HPLC on a Waters RCM (C-18) column (100 X 25 mm, 15mm) using as eluents (A) 0.1% trifluoroacetic acid in water and (B) 0.1%

5 trifluoroacetic acid in acetonitrile. The gradient used was 40%B isocratic for 5 min, then 40-60%B over 20 min, flow rate 30 ml/min; the fractions were analysed by HPLC (column: Beckman Ultrasphere, C-18, 25 X 4.6 mm, 5mm; gradient: 35-65%B in 20 min, same eluents as the  
10 preparative run, flow 1ml/min) and those containing the pure material were pooled and lyophilised (yield=50%). The Mass spectrum was acquired on a Perkin-Elmer API-100 spectrometer: MS= 1695.03 (calc.) 1694.6 (found).

15 (2) Inhibition Assay

The ability of the compounds to inhibit NS3 protease was evaluated using an NS3/4A complex comprising the NS3 protease domain and a modified form of the NS4A peptide, Pep 4AK [KKKGSVVIVGRIILSGR(NH<sub>2</sub>)]. As substrate, a

00.01.88 M

substrate peptide 4AB [DEMEECASHLPYK] based on the sequence of the NS4A/NS4B cleavage site of the HCV polyprotein, was used.

5           Cleavage assays were performed in 57  $\mu$ l 50 mM Hepes pH7.5, 1 % CHAPS, 15 % glycerol, 10 mM DTT (buffer A), to which 3  $\mu$ l substrate peptide were added. As protease co-factor a peptide spanning the central hydrophobic core (residues 21-34) of the NS4A protein, Pep4AK

10   [KKKGSVVIVGRIILSGR(NH<sub>2</sub>)] was used. Buffer solutions containing 80  $\mu$ M Pep4AK were preincubated for 10 minutes with 10-200 nM protease and reactions were started by addition of substrate. Six duplicate data points at different substrate concentrations were used to calculate

15   kinetic parameters. Incubation times were chosen in order to obtain <7% substrate conversion and reactions were stopped by addition of 40  $\mu$ l 1 % TFA. Cleavage of peptide substrates was determined by HPLC using a Merck-Hitachi chromatograph equipped with an autosampler. 80

M 25.12.99

$\mu$ l samples were injected on a Lichrospher C18 reversed phase cartridge column (4 x 74mm, 5 $\mu$ m, Merck) and fragments were separated using a 10-40 % acetonitrile gradient a 5%/min using a flow rate of 2.5ml/min. Peak  
5 detection was accomplished by monitoring both the absorbance at 220nm and tyrosine fluorescence ( $\lambda_{ex}$  = 260 nm,  $\lambda_{em}$  = 305nm). Cleavage products were quantitated by integration of chromatograms with respect to appropriate standards. Kinetic parameters were calculated from  
10 nonlinear least-squares fit of initial rates as a function of substrate concentration with the help of a Kaleidagraph software, assuming Michaelis-Menten kinetics.

15  $K_i$  values of peptide inhibitors were calculated from substrate titration experiments performed in the presence of increasing amounts of inhibitor. Experimental data sets were simultaneously fitted to eq.1 using a multicurve fit macro with the help of a Sigmaplot

00:51:35 M

software:

$$V = (V_{\max}S) / (K_m(1+K_i/I)+S); \quad (\text{eq.1})$$

5           Alternatively,  $K_i$  values were derived from IC50 values, calculated using a four-parameter logistic function, according to eq.2:

$$\text{IC50} = (1+S/K_m)K_i \quad (\text{eq.2})$$

10

The table below sets out the  $\text{IC}_{50}$  values for a variety of peptides tested in this assay and establishes that several optimised compounds of the present invention are active at nanomolar or subnanomolar levels.

15

Some of these compounds are the most potent in vitro inhibitors of HCV protease described to date. They are reversible, non covalent inhibitors which do not contain an electrophilic ("serine-trap") moiety in the molecule.

M 28.12.99

They bind to both the S and S' region of the enzyme, and  
this makes them suitable for developing competition  
binding assays, since they would be competitive with  
compounds binding to either the S or the S' region of the  
5 enzyme.

00 01 03 M

Abbreviations used in Table I:

Abu = aminobutyric acid

Cha =  $\beta$ -cyclohexylalanine

Hof = homophenylalanine

5 Hyp = hydroxyproline

Lys(Ac) = N $\epsilon$ -Acetyl-Lysine

Nle = norleucine

Phg = phenylglycine

Sta = statine [(3S,4S)-4-amino-3-hydroxy-6-  
10 methylheptanoic acid]

Dif = 3,3-diphenylalanine

Suc=succinyl

N-methylation is indicated as (Me) preceding the three-  
letter code of the amino acid

15

(3) Substrate Assay

In order to determine whether or not an inhibitor  
molecule was a substrate for HCV NS3 protease a modified

14.25.12.99

version of the cleavage assay described above was employed using, as before, an NS3/4A complex comprising the NS3 protease domain and a modified form of the NS4A peptide, Pep4AK [KKKGSVVIVGRIILSGR(NH<sub>2</sub>)].

5

1 $\mu$ M of the enzyme complex was incubated for 16hrs in the presence of 10 $\mu$ M inhibitor as a candidate substrate peptide. Assays were performed in 57 $\mu$ l 50 mM Hepes pH7.5, 1% CHAPS, 15% glycerol, 10 mM DTT.

10

After this time HPLC was used to separate any peptides resulting from cleavage and separated cleavage products detected.

15

Samples were analysed by HPLC on a Beckman 0.46 x 25 cm C18 reversed phase column equilibrated in 95% solvent A (0.1% TFA in H<sub>2</sub>O) and 5% solvent B (0.1% TFA in acetonitrile) at a flow rate of 1 ml/min. Samples were eluted from this column with a linear gradient from 5% to

00:21:32 M

90% of B in 45 minutes. Peak detection was accomplished  
by monitoring absorbance at 220 nm.
